TITLE: Polarisation of the quasilinear luminescence spectra of perylene in the electric field at 77 °K

PERIODICAL: Optika i spektroskopiya, v.13, no.6, 1962, 879

TEXT: This work was undertaken in order to observe the optical effects associated with radiation from electrets and to study the kinetics of the electret condition. Perylene was chosen because of its extensive cloud of π -electrons, which under the action of an electric field might produce a noticeable effect on its luminescent spectrum. In the absence of an electric field the luminescence of perylene in n-heptane observed at right angles to direction of the exciting beam (366 mmk natural light) is 32% polarised. The degree of polarisation along the line of excitation is zero. When a solution of perylene in n-heptane is frozen in an electric field of 25 kV/cm the luminescence observed along the line of excitation is 26% polarised. An investigation of the

Card 1/2

Polarisation of the quasilinear ... S/051/62/013/006/024/027
E039/E120

dependence of the intensity of luminescence on the position of the plane of polarisation of the exciting light in the absence of an electric field, and when frozen in an electric field, showed that the intensity in the first case remained constant, but in the second case could change by a factor of two. Electric polarisation observed by another author for organic solutions at room temperature and 150 kV/cm gave a degree of polarisation of 0.1. By using the electret condition and Shpol'skiy's method the authors have obtained significant electric polarisation of luminescence at comparatively small fields. Investigations are being carried out on other aromatic hydrocarbons (pyrene, chrysene and others).

Title: Investigation of Solid Phase Reactions for the Purpose of Revealing
Acid Insoluble Materials

Original

Periodical: Tr. Dnepropetr. khim.-tekhnol. in-ta, 1955, No 4, 95-107

Abstract: A number of solid-phase reactions have been investigated with a view toward achieving the solution of acid insoluble compounds. A 0.5 gms sample of iron ore agglomerate (A) was sintered with 0.3 gms Na_2CO_3 at 500-1,100°, in steps of 50°. The analysis of A was as follows (in percent): SiO_2 , 13.4; Fe^{3+} , 44.8; Fe^{2+} , 15.9; CaO , 1.08; Mn, 0.14; P, 0.023; S, 0.011. Maximum weight loss was observed for the mixture when sintering was carried out at 900-950°. At temperatures above 950° an insignificant increase in weight was

Card 1/2

USSR/Chemical Technology -- Chemical Products and Their Application. Silicates.
Glass. Ceramics. Binders, I-9

Abst Journal: Referat Zhur - Khimiya, No 1, 1957, 1545

Abstract: observed, owing to the oxidation of Fe^{2+} . Activation of the surface, determined from sorption properties, begins at 600° ; maximum sorption is observed at 900 and $1,100^\circ$. At $950-1,000^\circ$ sorption is sharply reduced. Mixtures sintered at 900° showed a maximum amount of $\text{Na}_2\text{Fe}_2\text{O}_4$; increasing the sintering time by 5 to 10 minutes reduces the $\text{Na}_2\text{Fe}_2\text{O}_4$ content. The rate of solution of the sintered samples in 1 N HCl (cold) increases when the temperature is raised to 900° and decreases at temperatures above 950° . Increasing the sintering time at $900-950^\circ$ 5 to 10 minutes leads to a reduction in solubility rate. For the purpose of establishing the mechanism of the reaction, a mixture of $\text{Na}_2\text{CO}_3 + \text{FeO}\cdot\text{SiO}_2$ was sintered, the proportion of the second component in A attaining 29.1%. When such a mixture is sintered at 900° the rate of oxidation of the ferrous oxide is slower than that observed when fayalite is heated in the absence of Na_2CO_3 . Samples sintered at $950-1,050^\circ$ for one minute exhibited the highest solubility rate. Increasing the temperature and sintering time reduces the rate of solution. The utilization of a mixture of 95% Na_2CO_3 and 5% NaCl or K NaCO_3 in the place of Na_2CO_3 reduces the optimum sintering temperature by 80-100°.

Title : Catalytic Dehydrogenation of Isopentenes into Isoprene

Orig Pub : Me'ruzeler Azerb. SSR elmer Akad., Dokl. AN Azerb. SSR, 1956,
12, No 8, 547-552

Abstract : The dehydrogenation of 3-methylbutene-1 (I) and 2-methylbutene-1 (II) with the industrial catalysts of the brands K₁₂ and K₁₆, which had been proposed earlier for the dehydrogenation of butenes (RZhKhim, 1956, 50637), was studied at 535 to 640°. It was found that also the dehydrogenation of isopentenes occurred with K₁₂ and K₁₆. The yield of isoprene by I reaches 14 to 16% of the raw material treated at 600 to 640° at a volumetric speed of 3.0 to 3.6 lit per lit of the catalyst per hour in case of K₁₂, and the yield by II reaches 15.5 to 18%; in case of K₁₈, the yield of isoprene by I is 22 to 24%, and that by II is 19 to 20% of the treated raw material.

Gosenergoizdat, 1958. 190 p. 9,450 copies printed.

Ed.: A.L. Fayerman; Tech. Ed.: G.I. Matveyev.

PURPOSE: This book is intended for engineers and technicians concerned with the survey and design of cable transmission lines. It may also serve as a textbook for students of power-engineering institutes and teknikums.

COVERAGE: The book covers problems of surveying and designing 3 - 35 kv cable transmission lines for industrial plants and cities. It also deals briefly with the laying of various underground communication lines serving the cable networks. The authors discuss problems of investigating ground conditions along the proposed cable route and outline a detailed program of preliminary survey and technical investigation. They provide information necessary for selecting the type and size of cable, and information on cable-laying methods, capping and connecting conductors, and methods of grounding and protection against corrosion. The section

Infek. odd. SON, Bulovka, Praha; Detske odd. SON, Bulovka; Novy diagnosticky test na leptomeningitidu tbc A New diagnostic test for tuberculous leptomeningitis CAS. LEK. CES. 1953, 92/4 (115-117) Illus. 5

Ten ml. CSF from the suspected patient is reduced by heating to about 1 ml. of this substance 0.4 ml. (in children 0.3 ml.) is injected intradermally into the same patient. After 48 hr. an infiltration develops in positive cases. Within 24 hr. after the injection an unspecific local reaction may occur, which, however, disappears before the possible appearance of the infiltration. In animal experiments it was demonstrated that a tuberculin-like material is in the CSF in tuberculous meningitis which results in the positive reaction. The test is negative in chronic cases of the disease treated by streptomycin. A series of 4 cases is added to demonstrate the reliability of the test.

Orig Pub: Ceskosl. mikrobiol., 1956, 1, No 4, 183-188.

Abstract: The method consists of staining non-fixed bacteria with methylene blue and subsequent oxidation with potassium ferricyanide or hydrogen peroxide and counterstaining by basic fuchsin. In these cases, in some of the bacteria studied a double stain appears; actively metabolizing cells are stained green-blue or blue, and inactive ones are stained red. This phenomenon is not observed in other bacteria.

Title : Cultivation of Mycobacterium Tuberculosis in Tissue Cultures.

Orig Pub : Rozhl. tunerk. a nemozech plichnich, 1956, 16, No 4, 178-
180

Abstract : The medium for cultivating tubercular bacteria (TB) in tissue culture has the following composition: to a mixture of 80 parts of Hank's solution, 10 parts of embryonal extract and 10 parts of an active horse serum, are added 0.002% of phenol red and 100 units of penicillin per ml. The embryonal extract is prepared by emulsifying 0.6 ml of embryonal tissue taken from a ten-day old hen fetus

1558. KALINA Č. Infek. Klin. Bulovka, Praha. *Toxicke příznaky po chloramphenikolu. Toxic symptoms following the use of chloramphenicol CAS.LÉK.CES.1956, 95/6 (164-165)

Toxic symptoms were seen in 26 out of 138 patients with typhoid fever treated with chloramphenicol. In the beginning of intoxication nausea and vomiting appeared, then successively: diarrhoea, toxic stomatitis; tongue is red and tender; on the gingivae, lips, palate and buccal surface there are exanthemas. In 12 patients there was a toxic exanthema, red spots 2 X 3 mm, in diameter on the face and breast. When administration of chloramphenicol is continued, collapse can appear. Exceptionally psychic disturbances can be seen (hallucinations, excitation). No agranulocytosis or thrombopenia was noted.

TITLE: Perfecting Machine Manufacture of Type PO Conductor
(Usovershenstvovaniye mashiny dlya izgotovleniya provoda marki PO)

PERIODICAL: Sb. rats. predlozh. M-vo elektrotekhn. prom-sti SSSR, 1955,
Nr 54, pp 20-21

ABSTRACT: Type PO conductors consisting of a cotton or silk core, a nickel-chromium wire, and a cotton-yarn braid were formerly manufactured in three steps. It has been suggested that the winding machine be improved in such a way that the nickel-chromium wire imposition and braiding be done simultaneously. The improved machine construction is described; it includes an automatic device that stops the machine if there is a wire or cotton-strand break. The above reconstruction has resulted in increased productivity, in elimination of the braiding pass, and in a higher conductor quality. "Podol'skkabel' " Plant.

1. Argument of "no" to the "should" of a particular research
activity. This argument can be based on either policy
decisions or on the specific characteristics of the
research. Examples include: 1) Research does
not fit into the programmatic priorities of the
agency; 2) The research is not feasible.

2. "Should" of a single activity. An argument for "should" based on
"principles" and "values." These principles may be
derived from the agency's mission statement, general
policy, or other sources. Examples include: 1) The
research is consistent with the agency's mission
and values; 2) The research is consistent with
the agency's policy on research.

3. "Should" of a single activity. An argument for "should" based on
public health priorities. Examples include:
a) Public health priorities. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

4. Argument for and against particular types of research activities.
For example, "should" of a particular type of research
activity. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

5. "Should" of the research in general. Cases can be made for
or against the research in general. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

6. "Should" of research in a discipline. This argument is used to
discourage funding of research in a discipline.

7. "Should" of the research in a specific area. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

8. "Should" of the research in a specific area. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

9. "Should" of the research in a specific area. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

10. "Should" of the research in a specific area. Examples include:
- The research is consistent with the department's
public health priorities. Examples include:

TITLE	: The Use of Paper Chromatography in the Control of the Synthesis of Pyridoxine	
ORIG. PUE.	: Ceskoslov Farmac, 7, No 7, 400-402 (1958)	
ABSTRACT	: A chromatographic method has been developed for the determination of the substances formed in the synthesis of pyridoxine by the method of Harris and Folkers (JACS, 61, 1245 (1939)). The new pro- cedure makes it possible to determine with sufficient accuracy the degree of purity of the individual prod- ucts, the amount of side products formed, or the concentration of starting materials. AUTHOR KALINA, L.I. Engineer 105-6-18/26
TITLE A Compound Device for Generators in Rural Power Stations.
(Kompaundiruyushcheye ustroystvo dlya generatorov sel'skikh elektrostantsiy - Russian)
PERIODICAL Elektrichestvo, 1957, Nr 6, pp 72 - 74 (U.S.S.R.)

ABSTRACT A compounding device, which reacts to the $\cos \varphi_B$ of load and in this way automatically keeps the generator voltage constant with the necessary inertia (5%) within the range from idling to nominal load, is described. This device makes it possible to start short circuit asynchronous motors the efficiency of which is commensurable with that of the generator. Reaction to the $\cos \varphi_B$ is attained by the application of a three-core transformer. An experimental variety of this device for a 2,5 kw generator was produced and tested in the electric laboratory of the Technicum for the mechanization of agriculture at Talgar. The essential element in the automatic control circuit is the three-core transformer, the secondary current of which depends on the amount of the phase and the load. The transformer is characterized by its peculiar position and connection of windings, which leads to a qualitative modification of the character of the process and to a quantitative modification of conditions among the corresponding quantities during operation. There follows a detailed description of the operation of the transformer.
